Eating is the basic need of every human being. Some people may not know how to cook. That's why they need recipes. Now everyone is using the internet in their phones, tablets or computers. Almost no one uses pen and paper in routine life. Now, the easiest way to access to recipes is the internet. Our goal is to create a social platform where recipes are easily acquired.

In this project we are going to do a website with using ASP.NET technology. Also, we will utilize from MS SQL Server for holding data in our database system. Our project's name is 'TARİFİ BENDE'. We think that our target community is housewives. But this is not a restriction, anyone who wants to learn about meals can also view our website. Thanks to this website, housewives can view different receipts from different users. Also, each receipt has comments and average score from the users. Any score from the users will be accepted but comments which is only confirmed from the administrator can be seen in the website. Moreover, we are planning to append photos and videos about our topic in our website in order to prettify user interface.
